GitHub: https://github.com/vamsi462/Flask_and_MongoDB_Assignment

Task: 1

I created a Flask application with an /api route that reads data from a local data.json file. I used **Flask's jsonify** function to properly format the list and returns a JSON response and here is the response when I hit 127.0.0.1:5000/api

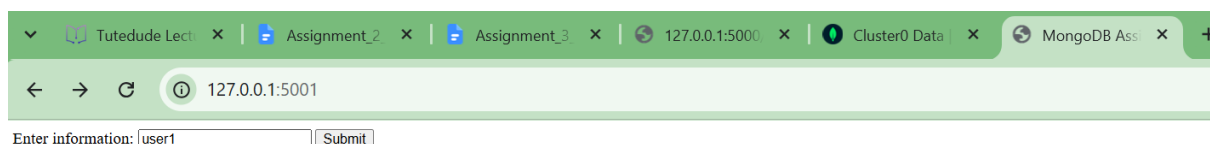

```
{
  "id": 1,
  "place": "Charminar",
  "visited": "yes"
},
{
  "id": 2,
  "place": "Hussain Sagar",
  "visited": "yes"
}
```

Task 2:

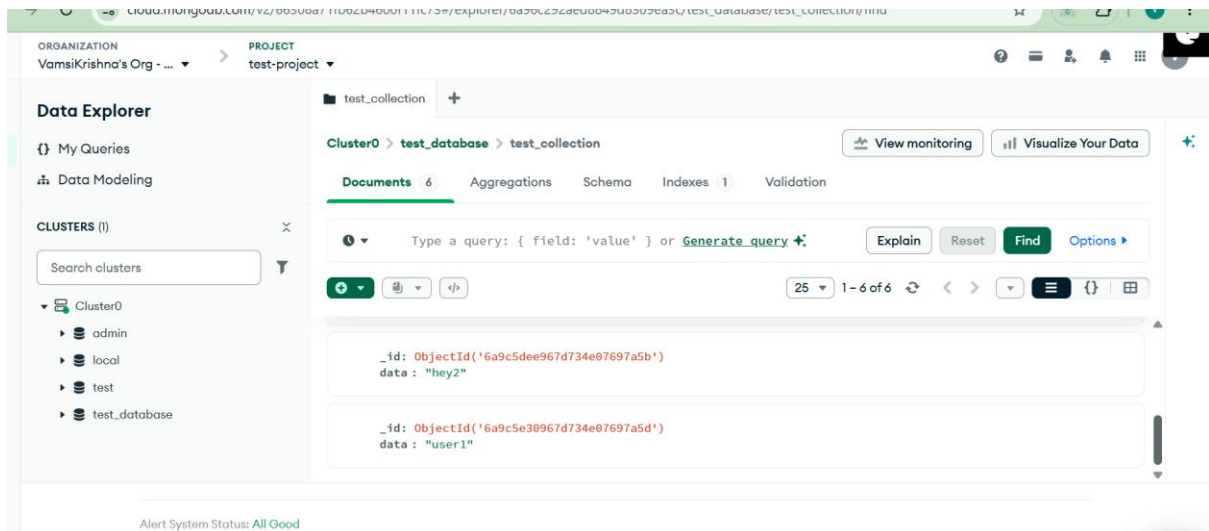

Step 1: I created an index.html file with a simple form. When the user types the information and click on submit it sends a POST request to the server.

Step 2: In Python script, I imported MongoClient from PyMongo to connect the app to the MongoDB Atlas cluster using MONGO_URI string, for this I have setup the mongo by following the steps from the class.

Step 3 : on successful connection and submitting the data from the form it will redirect to the success page displaying the message and inserting the data to db using the .insert_one() method.

Data submitted successfully

Step 4: To test the error handling, I intentionally changed the MongoDB URI to an invalid string for failed connection, to catch errors I have created except block to catch block and it renders the error message inside the html only instead of server crash.

```
MONGO_URI = "mongodb+srv://krish:12345@clustwer0.dnkqm.mongodb.net/?appName=a"
```

127.0.0.1:5001

Error: Connection failed
